

PhyzJob: Electric Field Graphing

Make a data table, then plot the strength of the electric field vs. the distance from the spherical charges shown below. *Hint: the field is symmetrical around the charge and the sphere itself is a conductor.*

d (mm)	E (N/C)
15	
30	
60	

$Q = +2 \text{ pC}$
 $R = 15 \text{ mm}$

Equation you used to find E:

d (mm)	E (N/C)
15	
30	
60	

$Q = -2 \text{ pC}$
 $R = 15 \text{ mm}$

Suppose the graph represented a small track on which a marble could roll. If a marble were placed on the graph 30 mm away from the center of the charge and released, which way would it roll?

Suppose the graph represented a small track on which a marble could roll. If a marble were placed on the graph 30 mm away from the center of the charge and released, which way would it roll?

How does this compare to the motion of a free proton placed 30 mm from the center of the spherical charge?

How does this compare to the motion of a free proton placed 30 mm from the center of the spherical charge?

What would an electron placed 30 mm from the spherical charge do if released?

What would an electron placed 30 mm from the spherical charge do if released?
